

Project Summary

Objective

Analyze e-learning purchase data using MySQL to identify learner behaviour, sales performance, and popular course categories.

Key Insights

- Database and Programming courses generated the highest revenue.
- SQL Masterclass and Python for Data Analysis were among the most purchased courses.
- Some learners purchased courses from multiple categories, indicating broader learning interests.
- High-value learners contributed significantly to total revenue.
- The category performance view provides a quick overview of revenue and purchase trends by course category.

Recommendations

- Increase marketing efforts for the highest-performing course categories.
- Offer bundle discounts to encourage purchases across multiple categories.
- Target high-value learners with premium or advanced courses.
- Promote courses with low purchase counts using special offers or personalized recommendations.

Conclusion

This project successfully demonstrated the use of MySQL for database design, data retrieval, and business analysis. By implementing advanced SQL techniques such as joins, aggregate functions, subqueries, CTEs, CASE expressions, NULL handling, and views, meaningful insights were extracted from the e-learning purchase data. These insights can help management understand customer behaviour, identify revenue-generating opportunities, and make data-driven decisions to improve business performance and learner satisfaction.
